(54) Title: POWER AMPLIFIER WITH PRE-DISTORTER

(57) Abstract: Amplifier apparatus comprising a power amplifier (4) having an operating frequency in the radio frequency ('RF') or microwave or higher ranges and a pre-distorter (2), the characteristics of the power amplifier (4) comprising a distortion from a linear transfer function. The pre-distorter (2) comprises a non-linear path (7), a linear path (8), input means (6) responsive to an amplifier input signal for applying respective prre-distorter input signals to the paths (7,8) and combining means (13) for combining a linear signal from the linear path (8) with a non-linear signal from the non-linear path (7) to poduce a pre-distorted signal. The characteristics fo the pre-distorter (2) comprise a distortion relative to a linear transfer function such as to tend to compensate for the distortion of the transfer function of the power amplifier. The input means (6) is arranged to apply the pre-distorter input signals to the paths (7,8) substantially in relative phase opposition (+90) and the combining means (13) is arranged to combine the signals from the paths (7,8) without introducing any significant relative phase difference. The input means (6) and the combining means (13) consist substantially of passive components (16 to 21, 30 to 36) and substantially all the components of the pre-distorter (2) are formed in a common semiconductor substrate.
